

# SCAFFOLD TOWER SAFETY

## A Basic Checklist

### 1

#### Instructions

##### Erecting and Dismantling the Scaffold Tower

You must provide our instructions for erecting and dismantling to the person undertaking it and the person supervising the process.

### 2

#### Inspections

##### At the Time of Assembly and Every 7 Days in Construction

Scaffold towers must be inspected by a competent person once the tower is assembled. It must be re-inspected every 7 days if it's used on a construction site.

### 3

#### Stability

##### Only Use a Scaffold Tower on a Level Surface

Never use bricks or building blocks to level the scaffold tower. Only use our height adjustable castors and base plates.

### 4

#### Safely Using

##### Never Use a Scaffold Tower When It's Not Safe

It's not safe to use when the wind is strong, as a support for other access equipment like ladders, with broken or missing parts, or with incompatible parts.

### 5

#### Safely Moving

##### Only Move a Scaffold Tower When It's Safe

Only move it from the ground when it's height is lower than 4 metres and nothing is on the platform. Check for obstructions on the ground and overhead.
